

FOR IMMEDIATE RELEASE

LOGMEONCE CEO KEVIN SHAHBAZI: DO NOT CHANGE YOUR PASSWORDS UNTIL HEARTBLEED BUG IS FIXED

In the wake of the Heartbleed Bug, some inexperienced vendors are suggesting users change their passwords, but this won't protect them from further attacks

WASHINGTON, D.C., April 15, 2014—Last week, the Heartbleed bug was discovered. Since then, many companies and a few inexperienced security vendors have rushed to put out ill-advised statements. One of those theories is that users need to immediately change their passwords so they can maintain their online security. According to LogmeOnce CEO and security expert Kevin Shahbazi, this will not only not protect you, it could increase your risk of a cyber attack.

“Users should not change their passwords right now, it will not help the situation,” says Shahbazi. “The problem with sites affected by the Heartbleed Bug is that hackers can visibly see your passwords. And until the infected sites clear up the problem themselves, it is advisable not to change your password. And be careful because the Heartbleed Bug affects more than just websites, it can also get into smart phones, security cameras, switches, virtual private networks, company video conferences, etc. It’s a very serious security issue and that can’t be overstated.”

This problem stems from the fact that the majority of people rely on one layer of protection (ex. SSL). LogmeOnce believes security is a multi-layered approach to build your defenses. Because LogmeOnce doesn’t use a third-party USB sticks, their military-grade, 26-layer encryption method operates entirely within the LogmeOnce system, providing even better protection. This is the only company in the market that offers one unified solution -- a software key and a hardware key -- without the need for third-party integration, which means even greater security for end users.

Fresh off their experience at Trust Digital, which was acquired by McAfee in 2010, founders Kevin and Mike Shahbazi launched LogmeOnce on April 3. The LogmeOnce password manager lets users securely log in from any device with a master password. LogmeOnce is the only company in the market that provides users with multiple options to save their credentials and store in an encrypted cloud, their own desktop or a LogmeOnce USB. It also supports multi-factor authentication, which will significantly cut down the amount of time and effort users need to manage their accounts while giving them peace of mind.

About LogmeOnce:

Confidently helping consumers and organizations protect their identity, data and information with identity and access management solutions, LogmeOnce develops, markets and supports a seamless and secure Single Sign-On, Identity and Access Management productivity suite. During the past two decades, the LogmeOnce executive management team has earned a global reputation for innovative, standards-based security solutions and has captured numerous national and international industry awards. As an Independent Software Vendor (ISV), LogmeOnce's security suite includes a wide range of products, productivity solutions, cryptographic and e-security applications. LogmeOnce markets and sells its solutions worldwide directly and through a variety of partners.
